

TryHackMe Rooms conclusion Report

Room no. 1: Hello World(<https://tryhackme.com/room/hello>):

Learning Objectives: This room gives the user an introductory insight into deploying the required website which is needed to be analysed and familiarise you with the platform TryHackMe and used tools on the platform.

Key Tools/Commands used:

TryHackMe platform, Firefox browser are the platforms used to deploy the website on the machine.

Concepts learned:

In this room, I have learnt the apt way of hosting a website on the machine be it virtual in order to maintain and check for the vulnerabilities in the system and help in improving it.

Walkthrough:

This room was solved using the following steps:

- I. Firstly, the sideview machine was initialised where we will be using for deployment.
- II. Then the given IP address was copied in the Firefox browser of the machine.
- III. Lastly the flag named flag {Connection_verified} appeared which confirmed the website is deployed.

Reflections or notes:

- The "Hello World" room is an excellent starting point for beginners in cybersecurity. It simplifies complex concepts and provides a user-friendly interface for learning.
- It highlights the importance of hands-on practice in building foundational skills.
- The interactive environment fosters curiosity and encourages further exploration of cybersecurity topics.

Room no. 2: How To Use TryHackMe(<https://tryhackme.com/room/howtousetryhackme>)

Learning Objectives:

This room helps to understand the usage of the platform TryHackMe and the technical knowhow so that a beginner level student is able to walkthrough the tasks to learn and progress in the learning journey.

Key Tools/ commands used:

Attackbox is used as a virtual machine such that the website is not needed to be hosted at the local machine.

Firefox browser is the browser on which IP addresses of websites are copied and used.

Concepts Learned:

- I. Start machines and learnt what makes them vulnerable.
- II. Access deployed machines by the attackbox or via OpenVPN.
- III. Put your knowledge into use by hacking real-world machines.

Walkthrough/How you solved it:

- I. Firstly, I started the machine on the attackbox.
- II. Then 'ls' command to list all the files and folder present on the directory.
- III. I also used the command named 'cd' in order to change the directory.
- IV. I used the command named 'cat<filename>' to view the inside content of the file.
- V. Then terminated the attackbox.

Reflections or notes:

- I. In this room the attackbox is operated as Linux operating system.
- II. Commands like 'ls', 'cd', 'cat<filename>' are used to list files, change directory, see the file's content respectively.

Room no. 3: Getting started (<https://tryhackme.com/room/gettingstarted>)

Learning Objectives:

This room allows us to hack a fake social media website and learn about rooms in THM and how to complete them, how to launch a VM and access a website it serves, how to exploit a simple vulnerability in a website

Key tools/Commands used:

- Attackbox powered by TryHackMe is used.
- Terminal or command prompt of the machine is used to run commands.
- Firefox browser is used to host the website and its inspect feature is used.

Concepts learned:

- Learned about rooms in THM and how to complete them
- Learned how to launch a VM and access a website it serves
- Learned how to exploit a simple vulnerability in a website

Walkthrough/ how you solved it:

- I. Launched the machine using attackbox.
- II. Used the given IP address to get to the desired websites.
- III. Inspect the website in order to get the vulnerabilities to get the user's username and password.
- IV. Some default combinations of username and password were used to pass the security step.
- V. Used the brute force method to guess the sent verification code from 0001 to 1000.
- VI. Then the password is reset, and the user id is logged in.

Reflections or notes:

- I. Passwords should not be so common which can be easily guessed by the trespasser.
- II. Verification code should not be shared with any unknown person.
- III. Also if an activity is noticed it should be immediately monitored and reported.

Room No. 4: TryHackMe Tutorials(<https://tryhackme.com/room/tutorial>)

Learning Objectives:

Learn how to use a TryHackMe room to start your upskilling in cyber security.

Key tools/Commands used:

- Attackbox machine – tool of TryHackMe is used
- IP address is used to host the site.

Concepts learned:

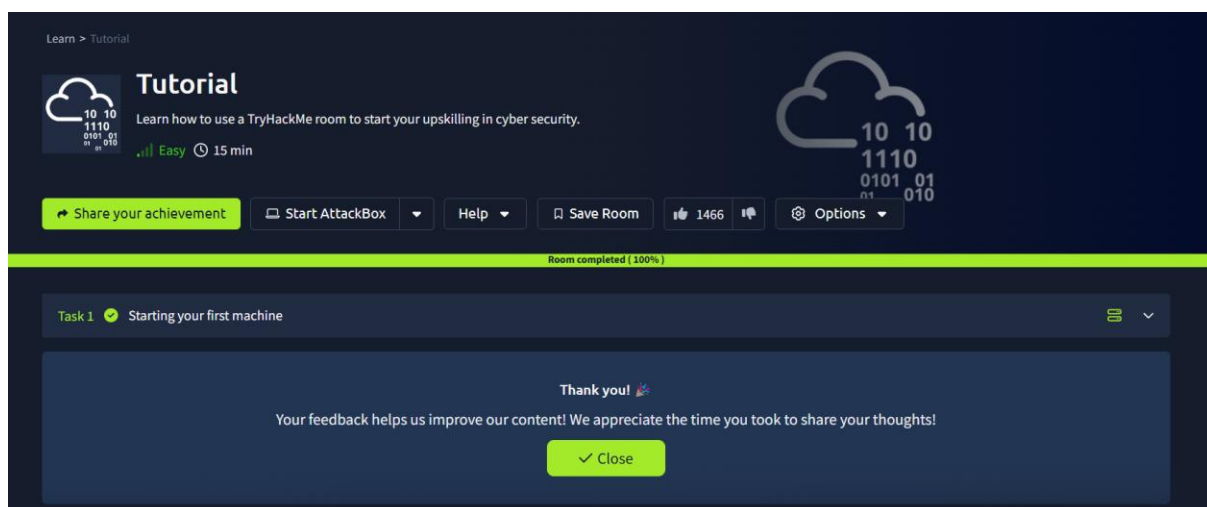

Using the attackbox, a web-based machine used to attack each other machines we start on tasks.

Walkthrough/how you solved it:

- I. Started the machine and learn what makes the website vulnerable.
- II. Access deployed machines by the Attackbox or via OpenVPN.
- III. Put my knowledge into use by hacking real-world machines.

Reflections or notes:

- I. A flag is just a piece of text that's used to verify you've performed a certain action.
- II. In security challenges, users are asked to find flags to prove that they've successfully hacked a machine

Room No. 5: OpenVPN configuration(<https://tryhackme.com/room/openvpn>)

Learning objectives:

Learn how to use OpenVPN and a guide to connecting to our network using OpenVPN

Key tools/Command used:

OpenVPN and its configuration to connect the network in private network.

Concepts learned:

OpenVPN GUI is an open-source application which can be used to host the website in a private network along with its configurations.

Walkthrough/how you solved it:

- I. Firstly, I downloaded OpenVPN GUI application from the given link.
- II. Then, downloaded its required configurations to connect it to my desktop.
- III. Open and run the OpenVPN GUI application as Administrator.
- IV. The application will start running in the system tray. It's at the bottom of your screen, near the clock. Right click on the application and click **Import File**.
- V. Select the configuration file you downloaded earlier (download from the [access](#) page)
- VI. Now right click on the application again, select your file and click **Connect**
- VII. successfully connected. To disconnect, follow step 6 and click **disconnect**.

Reflections and notes:

To access a to be tested website, it needs to be operated in the in a private network, that's what is done using OpenVPN open-source application.

- Task 6 ✔ Check you're connected

Room No.6: Beginner's path introduction(<https://tryhackme.com/room/beginnerpathintro>)

Learning objectives:

Get a short introduction to a few of the security topics you'll be learning about.

Key tools/Commands used:

TryHackMe platform's attackbox or OpenVPN of the local machine.

Concepts learned:

Brute forcing methods to overtake a account on social media site.

Walkthrough/How did you solve it:

Understood how the web application vulnerabilities work.

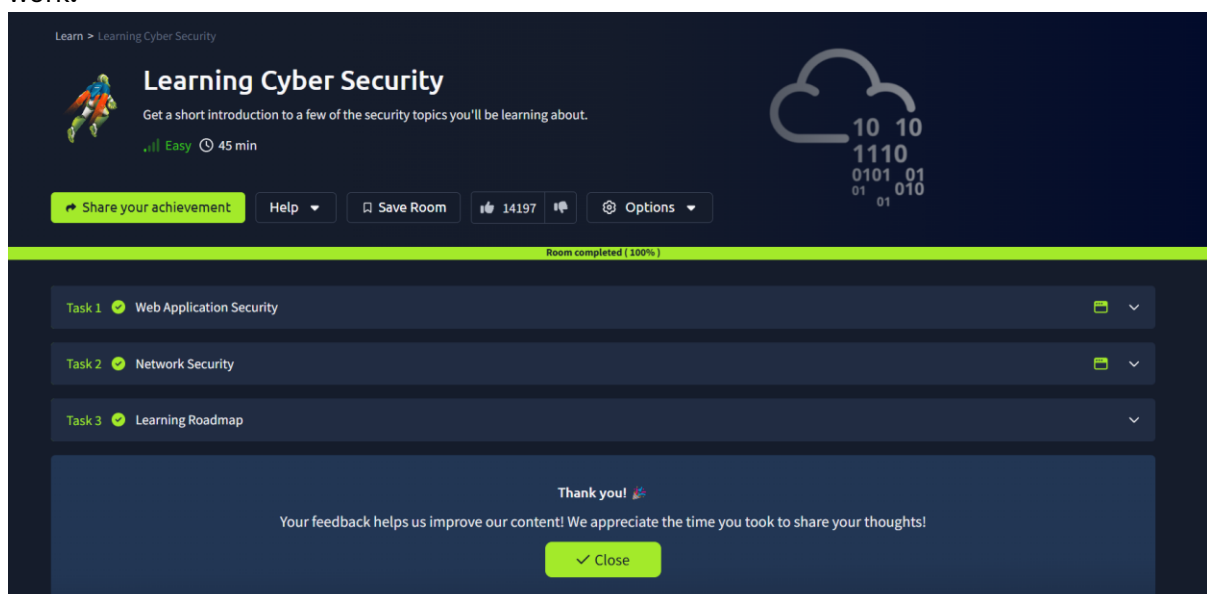

Viewed the BookFace website given at the attackbox machine.

Then tried to hack the account named Ben.Spring using the brute forcing method.

Analysed that how much is the estimated amount of total these kinds of crimes.

Reflection/notes:

Networking is really important to understand in cyber security. From scanning and identifying who and what is on a network, to reviewing network logs to monitor and track what users have been up to will require you to have an understanding of how networks work.

Room No. 7:

Starting out in Cyber Security(<https://tryhackme.com/room/startingoutincybersec>)

Learning Objectives:

Learn about the different career paths in Cyber Security and how TryHackMe can help!

Key tools/Commands used:

TryHackMe attackbox

Concepts learned:

- Defensive Security
- Offensive Security

Walkthrough/How you solved it:

- I. Started the attackbox machine, launched the given website.
- II. Read and learned about defensive and offensive security.

Reflection/Notes:

Offensive security: This area involves attacking different applications and technologies to discover vulnerabilities.

The most common offensive security job role is a penetration tester. A penetration tester is an individual that is legally employed by an organisation to find vulnerabilities in their products. A penetration tester usually requires a broad range of knowledge including:

- web application security
- network security
- use of programming languages to write various scripts

Defensive security: One of the careers under this track is a Security Analyst. This is an individual in an organisation whose job is to monitor various systems in the organisation and detect whether any of these systems are being attacked. Defensive Security involves detecting and stopping these attacks.

Room No. 8: Introduction to research(<https://tryhackme.com/room/introtoresearch>)

Learning Objectives:

A brief introduction to research skills for pentesting and To understand how to perform **effective cybersecurity research** using online resources. This includes learning how to find reliable information on vulnerabilities, tools, and techniques commonly used in cybersecurity analysis and ethical hacking.

Key tools/Commands used:

- Search engines (Google, DuckDuckGo)
- Online databases like:
 - [Exploit-DB](#)
 - [Shodan](#)
 - [CVE Details](#)
 - [VirusTotal](#)
- Google Dorking techniques

Concepts learned:

- What cybersecurity research is and why it's essential.
- How to look up CVEs (Common Vulnerabilities and Exposures).
- Using Shodan to find exposed devices.
- Understanding responsible disclosure in security research.
- Practicing safe and ethical research behaviour online.

Walkthrough/ how you solved it:

1. Completed reading material explaining what cybersecurity research is.
2. Practiced Google Dorking to find login pages and sensitive files.
3. Used Shodan to look up public devices with open ports (e.g., webcams).
4. Explored CVE databases to search vulnerabilities by software name.
5. Read about zero-day vulnerabilities and the importance of patching systems.
6. Answered questions at the end of each section to reinforce learning.

Reflections/Notes:

- Researching in cybersecurity is like detective work—it helps in finding how hackers think.
- Learning to verify sources is crucial since wrong info can mislead security decisions.
- This room showed how tools are helpful, but knowing how to search is a powerful skill on its own.
- Research is not just for advanced hackers—it's a core skill for all cybersecurity learners.
